

Composite products

– A powerful product from recycled material

Composite material is a very strong and important component used in many applications. The products have a high resistance to impact, shock, moisture and temperature changes. It is also appropriate for nails or screws. The usage of composite material makes the pallets extremely sustainable.

The material is produced from industrial waste, mainly from common polyethylene plastics, cardboard and paper fiber which are agglomerated and then extruded.

A rough combination of different materials in the composite:

Polyethylene	80%
Paper	15%
Other plastics	4%
Aluminum foils	1%

The plastics used contain no PVC. Composite products are environmental with high quality and competitive prices.

The usage of composite material in pallet blocks extends the life of the pallets. It is also appropriate for nails or screws.

Products

Item No.	Dimension mm	Height (lenght)	Massive or center hole*	Color	kg/block	kg/meter	pcs/pack

Vida Packaging offers complete logistics solution. Our target is to offer the right adaptable solution for each customer and their transport needs. Overall, we are able to offer an optimal combination of products and services.

Facts

Turnover 500 million SEK

Production 7 plants

Employed 150 people

Manufactured pallets/year 2,5 million

Manufactured collars/year 3,2 million

Manufactured cable drums/year 200 000
